

07.1_Strings_Iteration

February 27, 2023

1 Introduction to Python for Open Source Geocomputation

- Instructor: Dr. Wei Kang
- Class Location and Time: ENV 336, Mon & Wed 12:30 pm - 1:50 pm

Content:

- Quiz 1
- Strings
- Iteration with `for` loops

2 Standard Data Types in Python - strings

Category of Data type	Data type	Example
Numeric, scalar	Integer	1
	Floats	1.2
	Complex	1.5+0.5j
	Booleans	True
Container	strings	"Hello World"
	List	[1, "Hello World"]
	Tuple	(1, "Hello World")
	Set	{1, "Hello World"}
	Dictionary	{1: "Hello World", 2: 100}

```
[1]: my_string = "Hello World"
```

2.1 Indexing String

To access each separate character in a string

Structure: `string[index]` * string variable name * square brackets * index: integer (starts from 0 in python)

```
[2]: my_string[0]
```

```
[2]: 'H'
```

```
[3]: my_string[1]
```

```
[3]: 'e'
```

Group Exploration Task: How do we get the last character in this string?

```
my_string = "Hello World"
```

When you are done, raise your hand

```
[4]: my_string[10]
```

```
[4]: 'd'
```

```
[5]: len(my_string)
```

```
[5]: 11
```

```
[6]: length = len(my_string)
length
```

```
[6]: 11
```

```
[7]: my_string
```

```
[7]: 'Hello World'
```

```
[8]: my_string[length - 1]
```

```
[8]: 'd'
```

`len` is a built-in function that returns the number of characters in a string

```
[9]: my_string[len(my_string) - 1]
```

```
[9]: 'd'
```

```
[10]: my_string[11 - 1]
```

```
[10]: 'd'
```

```
[11]: my_string[11]
```

```
-----  
IndexError                                Traceback (most recent call last)  
/var/folders/6m/8n2ktxl566j8yp0n_qx7x5bw0000gt/T/ipykernel_30690/4123106262.py  
↳ in <module>  
----> 1 my_string[11]  
  
IndexError: string index out of range
```

2.1.1 Access the last charater in a string

- Find the index of the last charater
 - A built-in function called `len()` that gives the information about length of an object
- Use that index to access the character

Python starts counting at zero!

The index of the last element will always be: `len(string) - 1`

```
[12]: my_string[11-1]
```

```
[12]: 'd'
```

```
[13]: my_string[len(my_string)-1]
```

```
[13]: 'd'
```

2.1.2 Negative index

Another way to grab the last element so we don't need to calculate the length and subtract one.

Count backwards!

```
[14]: my_string
```

```
[14]: 'Hello World'
```

```
[15]: my_string[-1]
```

```
[15]: 'd'
```

```
[16]: my_string[-2]
```

```
[16]: 'l'
```

2.1.3 Index has to be an integer!

Data type matters

```
[17]: my_string[1.0]
```

```
-----  
TypeError                                Traceback (most recent call last)  
/var/folders/6m/8n2ktxl566j8yp0n_qx7x5bw0000gt/T/ipykernel_30690/904988526.py i  
  ↳<module>  
----> 1 my_string[1.0]  
  
TypeError: string indices must be integers
```

```
[18]: my_string[int(1.0)]
```

```
[18]: 'e'
```

```
[19]: my_string
```

```
[19]: 'Hello World'
```

```
[20]: my_string[len(my_string) - 1.0]
```

```
-----  
TypeError                                Traceback (most recent call last)  
/var/folders/6m/8n2ktxl566j8yp0n_qx7x5bw0000gt/T/ipykernel_30690/895010612.py i  
  ↳<module>  
----> 1 my_string[len(my_string) - 1.0]  
  
TypeError: string indices must be integers
```

```
[21]: type(len(my_string)- 1.0 )
```

```
[21]: float
```

2.1.4 strings are immutable

a string value cannot be updated

```
[22]: my_string
```

```
[22]: 'Hello World'
```

```
[23]: my_string[5]
```

```
[23]: ' '
```

```
[24]: my_string[5] = "_"
```

```
-----  
TypeError                                Traceback (most recent call last)  
/var/folders/6m/8n2ktxl566j8yp0n_qx7x5bw0000gt/T/ipykernel_30690/18060670.py in  
  ↳ <module>  
----> 1 my_string[5] = "_"  
  
TypeError: 'str' object does not support item assignment
```

```
[25]: 'Hello'+'_'+'World'
```

```
[25]: 'Hello_World'
```

```
[26]: 'Hello_World'
```

```
[26]: 'Hello_World'
```

2.1.5 in operator

- Check whether a substring occurs in the string
- Returns a boolean value

```
[27]: my_string
```

```
[27]: 'Hello World'
```

```
[28]: "d" in my_string
```

```
[28]: True
```

```
[29]: "hello" in my_string
```

```
[29]: False
```

```
[30]: "Hello" in my_string
```

```
[30]: True
```

3 Iterating over a string with for statements (for Loops) (traversal)

Traversal: start at the beginning, select each character in turn, do something to it, and continue until the end.

- for statements are used to iterate over sequences
- for/range statements are used to iterate over sequences using an index

The idea of *iteration* (in plain English) is to repeat a process several times. If you have any programming experience with another language (like C or Java, say), you may have an idea of how to create iteration with `for` statements. But these are a little different in Python, as you can read in the [documentation](#).

A Python `for` statement iterates over the items of a sequence, naturally.

```
[31]: my_string
```

```
[31]: 'Hello World'
```

```
[32]: for s in my_string:
      print(s)
```

```
H
e
l
l
o

W
o
r
l
d
```

```
[33]: print(s)
```

```
d
```

3.0.1 Syntax of a `for` statement

```
for s in my_string:
    print(s)
```

- `for`: keyword for for Loops (repetitions)
- `in`: operator
 - check whether a specified value is a constituent element of a sequence like string, array, list, or tuple etc.
 - `s in my_string`: check whether `s` is a constituent element of `my_string`
- logic:
 - assign the first element of `my_string` to `s`, execute the block that follows.
 - assign the second element of `my_string` to `s`, execute the block that follows.
 - ...
 - assign the last element of `my_string` to `s`, execute the block that follows.

3.0.2 Group Exercise (work in a two (or three) people group randomly assigned by the instructor)

Write a `for` statement to find each element in the string "python is fun!" and add a suffix "_suffix" to each element and print it out. For instance, the first printed out string is "p_suffix"

When you are done, raise your hand!

```
[ ]: s = "python is fun!"
     for substring in s:
         print(substring + "_suffix")
```

```
[36]: s = "python is fun!"
     for substring in s:
         if substring == " ":
             #     print(substring)
             #     break

             continue
         print(substring)
     else:
         print(substring + "_suffix")

     # print(substring + "_suffix")
```

```
p_suffix
y_suffix
t_suffix
h_suffix
o_suffix
n_suffix
i_suffix
s_suffix
f_suffix
u_suffix
n_suffix
!_suffix
```

3.0.3 `for`/range statements

Can be used to iterate over sequences (e.g, a string) using an index

- `range()`: a built-in function that provides a sequence of integers

```
for i in range(3):
    print(i)
```

```
[37]: for i in range(3):
     print(i)
```

0
1
2

```
[38]: a = "UNT"
```

```
[39]: a
```

```
[39]: 'UNT'
```

```
[40]: a[0]
```

```
[40]: 'U'
```

```
[41]: a[1]
```

```
[41]: 'N'
```

```
[42]: a[2]
```

```
[42]: 'T'
```

```
[43]: a
```

```
[43]: 'UNT'
```

```
[44]: for i in range(3):  
      print(a[i])
```

U
N
T

```
[45]: for i in range(len(a)):  
      print(a[i])
```

U
N
T

```
[46]: a = "sdfsdsdgsahgaegmoaejgpianbpiae"  
      for i in range(len(a)):  
          print(a[i])
```

3.0.4 for/range statements

Can be used to iterate over sequences (e.g, a string) using an index

- find the length of the string
- generate a sequence of integers (representing indexes)
- get the character using indexing

```
[47]: a = "python is fun!"
```

```
[48]: length_a = len(a)
      length_a
```

```
[48]: 14
```

```
[49]: range(len(a))
```

```
[49]: range(0, 14)
```

```
[50]: for i in range(14):  
       print(a[i])
```

p
y
t
h
o
n

i
s

f
u
n
!

3.0.5 Group Exercise

Write a for/range statement to print each element in the string "It is a great day!":

When you are done, raise your hand!

```
[52]: a_string = "It is a great day!"  
       for i in range(len(a_string)):  
           print(a_string[i])
```
